

The Work Work Loop

WWL/1.0.0 [START] 

- Role: The standing kernel for absolute artifact mastery.
- Mandate: Run the loop. Guarantee the artifact.

Standard agent interactions fail by collapsing distinct operational layers.

DIAGNOSTIC: UNSTRUCTURED FLOW

Standard AI Chaos

ANTI-PATTERNS (CHAOS)

- Anti-Pattern 1: Replaying phases after locking.
- Anti-Pattern 2: Skipping gates on full context.
- Anti-Pattern 3: Emitting chat without files.
- Anti-Pattern 4: The build-it-all mega-prompt.

DIAGNOSTIC: DETERMINISTIC ARCHITECTURE

The WWL Engine

WWL GUARANTEES (ORDER)

- WWL: Sequential spines; never loop back.
- WWL: Exhaustion is a split, not a skip.
- WWL: One durable artifact mandated per phase.
- WWL: Strict, single-phase execution.

Absolute control requires decoupling the system from the task.

Jamming these four layers into one prompt is the primary failure mode. Decoupling them is the WWL superpower.

Ten immutable laws govern the operating kernel.

The Phase Cycle is a closed, unyielding assembly loop.

Output is gated behind a flawless six-point quality lock.

The system exists to create artifacts, not conversation.

The Artifact Mandate

Every phase must produce exactly one primary durable object. Zero artifacts equals an automatic S4 failure.

Naming Convention

WWL-<spine>-P<N>-<slug>

The Hard Rule

Never emit a fake whole product script.
One durable object per phase.

Report

Spine 1 (BIBLE) transforms abstract ideas into locked blueprints.

[Strict Directive: After Phase 20, lock the bible. Stop. Do not loop back to 01.
Trim a phase only with a documented SKIP_REASON.]

The ShoulderAngels fork guarantees the artifact isn't just the first idea.

[Execution Points]

Triggered mandatorily at Phases 05 (Idea Fork) and 10 (Plan Fork).

[The Mechanic & Law]

Forecast distinct strategies, predict outcomes, lock one path. Do not skip without a SKIP_REASON. Prevents defaulting to mathematical averages.

Spine 2 (BUILD) executes the locked blueprint without inventing new stacks.

[Prerequisite: Only starts after Phase 20 is gated complete.]

[Strict Directive: Do not invent a new stack in BUILD. Lock the runtime in START.]

Exhaustion is a subphase split, not a skipped gate.

The Subphase Split

Stopping because the window is full is a **[SPLIT]** (drafting blue accent), not a complete. Each subphase is a full cycle with its own artifact and **[BNP]**.

The Recovery Protocol

If prompt is thin, automatically prepend:

- > Significantly improve upon this prompt and idea to produce the best possible end result and ensure its success 100% while maintaining the intent of the original prompt.

Rule: Then **[SCORE_IN]** and continue.
[Do not ask permission to improve.]

The Continuity Engine sustains the loop via the Best Next Prompt.

Tokenization

If IFCH enabled: self-@mention tokenized payload after GATE so a later seat can re-enter.

User Input

The user only ever needs to send one word: continue (runs the last BNP).

The Kernel adapts to the Harness without compromising the rules.

[Gemini Notebook]

Standing kernel in the first message. Chat = deliver.
Studio = artifact. User pastes BNP or types continue.

[Grail]

One grail-next per phase.
Never read past STOP. A missing-list is the work.
Evidence stays on disk.

[IFCH]

Optional self-@mention of TOKENIZED_BNP after GATE.
Never block GATE if IFCH is down.

[Generic Coding Agent]

Kernel + START is enough.
Artifacts are generated as files directly in the repository.

Initiation: The definitive START launch sequence.

WWL/1.0.0

[IDEA] <what to build or do>

[LOCKS] <non-negotiables, or none>

[SPINE] BIBLE

[TASK] Deliver a complete verbose summary of this system... then execute SPINE_BIBLE in gated phases.

[NEXT] Proceed Phase 01 IDEA as if the Best Next Prompt for that phase was just delivered.

Instance-specific rules go here (e.g., specific hex colors, no CDN, exact library versions). They do not belong in the Kernel.

Run the loop. Guarantee the artifact.

By restricting non-deterministic AI to single, gated, and rigorously scored phases...

By separating the operating rules from the task plan...

And by mandating the generation of durable objects...

The Work Work Loop systematically forces the generation of the best possible artifact you can create.

Work, work, work.
